
One EcoMesh node (one operating-system process, one event-loop thread)
Web interface
survivor screen | rescue console | engine pages
API server (FastAPI)
REST + WebSocket
node.py
wires the layers: send(), ACK/retry loop, store-and-forward flush
Discovery
HELLO, neighbour table, link quality
Routing
link-state gossip, graph, Dijkstra
Reliability
TTL, dedup, ACK, priority, store-fwd
Crypto
AES-256-GCM, Ed25519
Storage
SQLite (WAL): messages, events, peers
Transport interface
send | broadcast | on_receive | start | stop
implements
SimulatedTransport
in-memory links with loss and latency
LanTransport
TCP sockets + topology file
UdpTcpTransport
UDP multicast + TCP
simulated
TCP
multicast / TCP
Neighbour nodes
(other processes or laptops)
