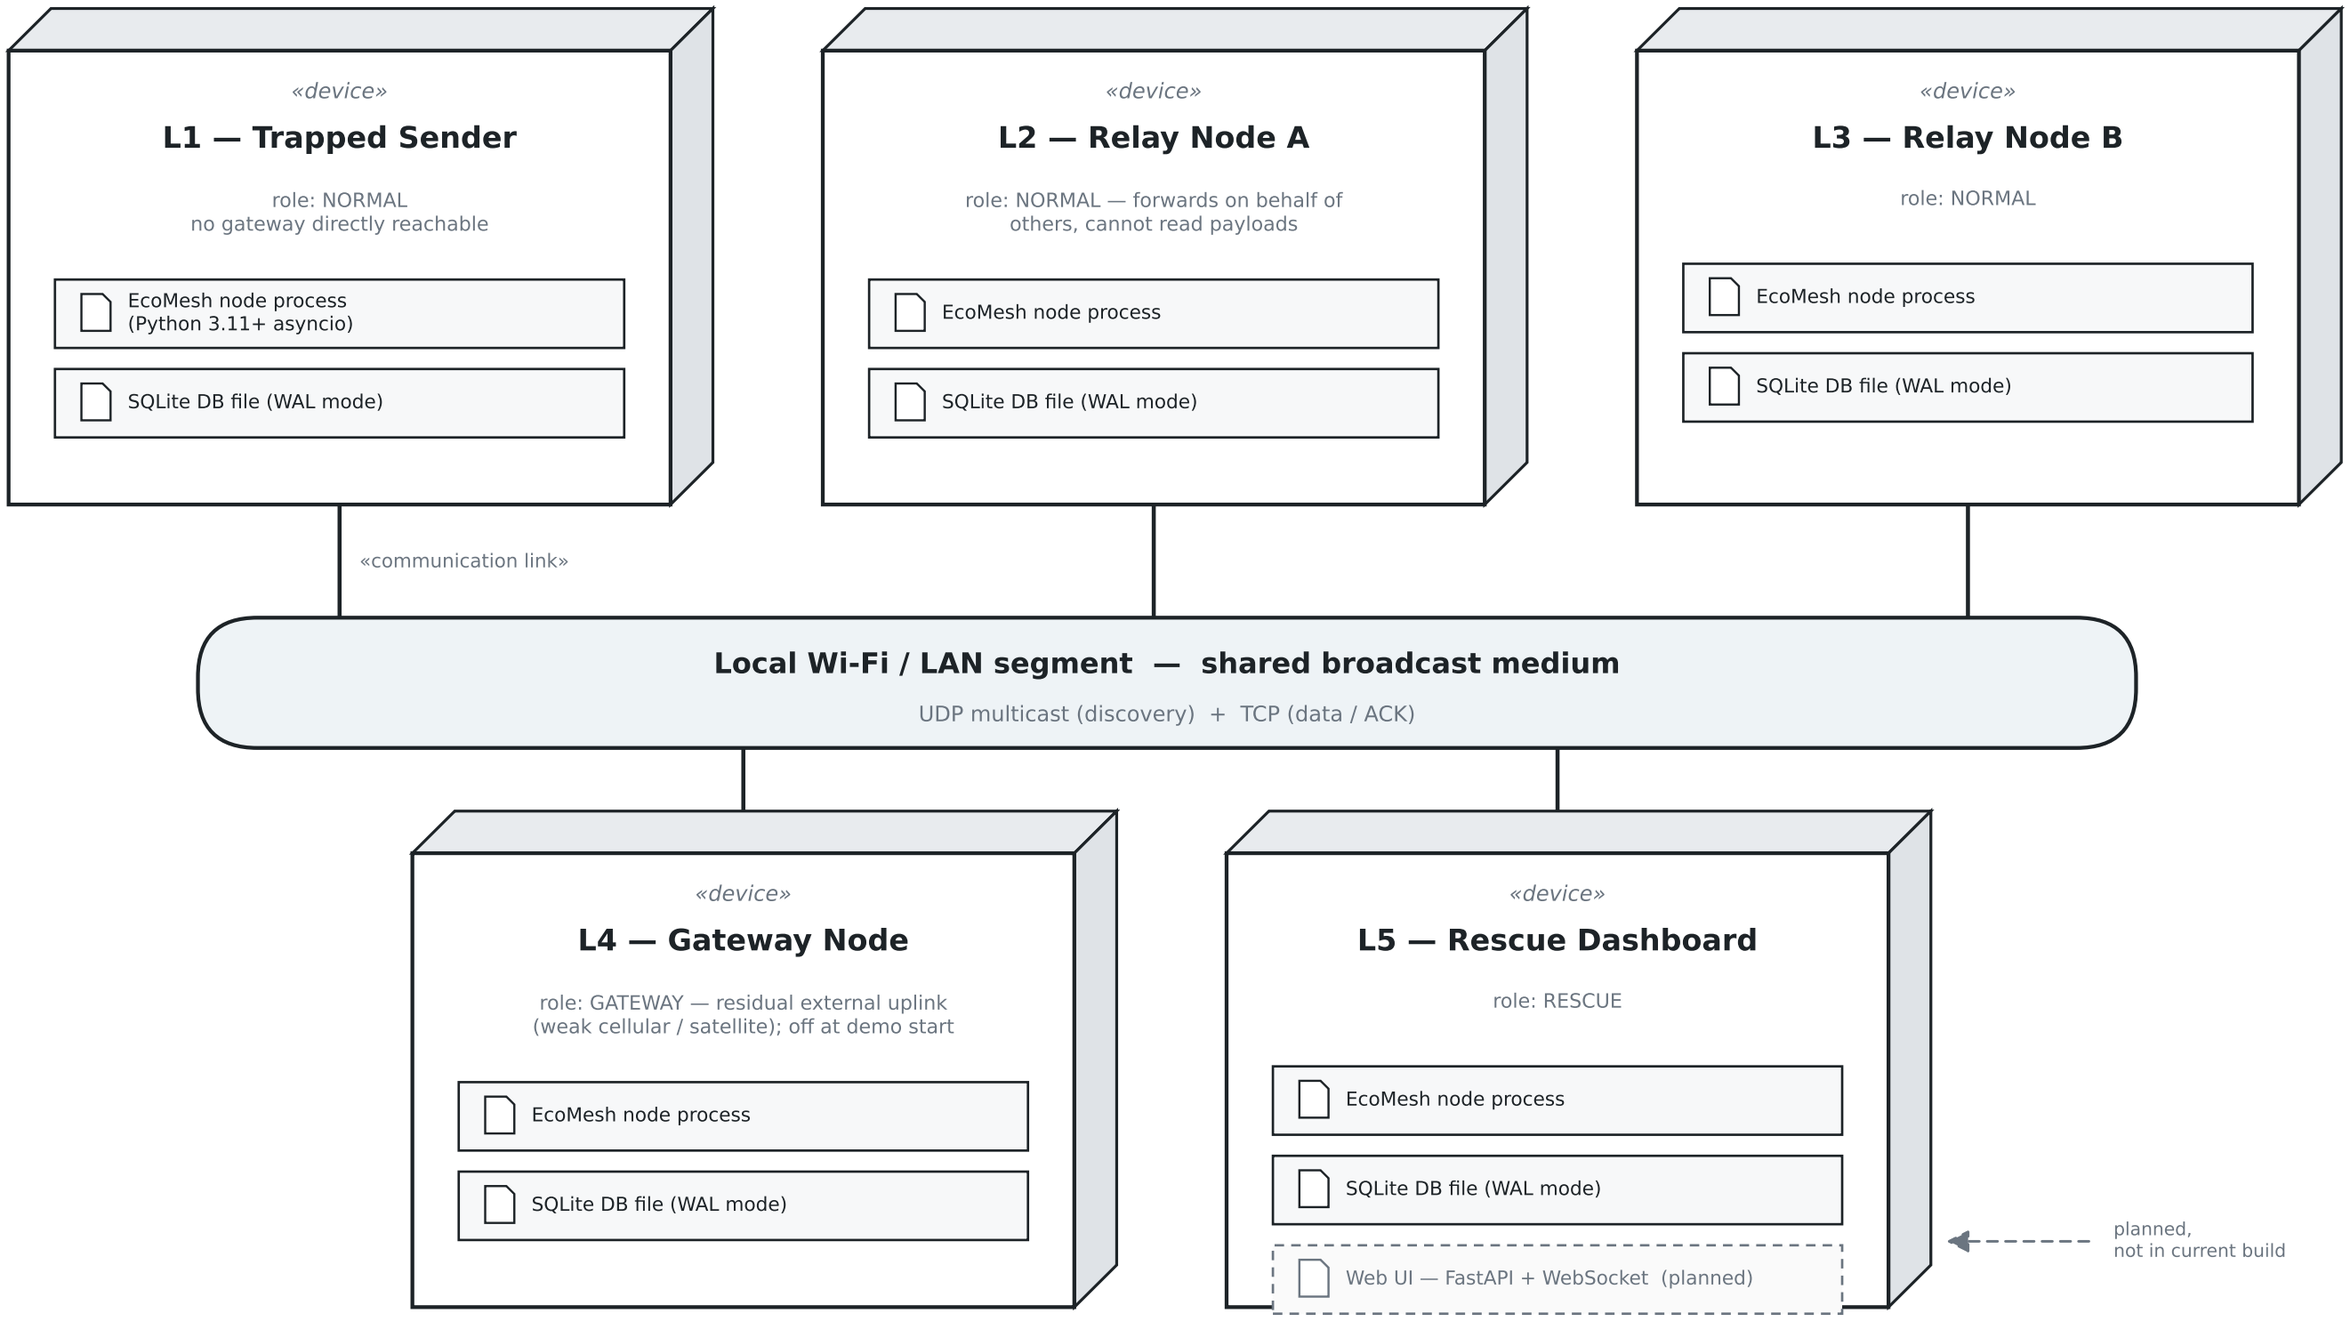
EcoMesh Physical Deployment (Demo Configuration)

UML Deployment Diagram · five peer machines on one LAN segment · no central server, no cloud



note: Every node is architecturally identical — role (NORMAL / GATEWAY / RESCUE) is configuration, not a different codebase.
Each node persists its own independent SQLite database; there is no shared or central database, and no node acts as a server for any other.
This LAN transport stands in for Bluetooth Low Energy or Wi-Fi Direct in a future radio deployment — replacing it does not change any layer above the transport interface.
